

There was a time in the not-so-distant past when the idea of planting on the tops of buildings or even down walls seemed futuristic and somehow unattainable. However, we have caught up with the idea and while there are some commonly referenced examples, every year more “vegitecture” appears on both new and old buildings all over the world. Check out the list below for the many varieties we offer that can be used in green roof construction.

### GREEN ROOF BENEFITS:

- Reduces impervious surface areas, which in turn reduces storm water runoff
- Filters pollutants and CO<sub>2</sub>
- Lowers energy consumption by increasing insulation
- Provides wildlife habitat in urban settings
- Creates an aesthetically pleasing environment!
