

## DEEP 72-CELL PERENNIALS

*Skagit Super Starts!*<sup>TM</sup> Deep 72-cell compared to a Standard 72

### DEEP 72-CELL PERENNIALS: OUR SECRET'S DOWN UNDER

This 72-cell plant is significantly larger than the standard, square/shallow 1" x 2 1/4" 72-cell. The octagonal, deep 72 measures a whopping 1 9/16" x 3 1/16"!

There are many reasons we like this design, the most important being that it helps grow better plants. The large 72 encourages the roots to grow down the plug instead of spiraling around. We have found that we can develop a more mature plant that transplants more labor-efficiently and with less shock. This means it takes less time to finish after the transplant. It is perfect for a quick finish in a gallon or large-sized container.

Another advantage of this design is that some cultivars need a more spacious rooting environment to develop enough crown mass and energy to thrive after a dormant period. Depending on hardiness, this is the perfect cell size to order in during the fall months for overwintering.
